

Transform to an agile, dynamically responsive network

HPE Network Transformation Workshop

Bringing the network up to pace with the speed of business

Network enable your business

Be an organization that thrives in the idea economy ready to act with speed to increase opportunities and shorten time to value

- Enable seamless and secure connections to business resources, by moving to a mobile first workplace
- Provide the on-demand foundation for 100 percent of the apps and workloads that power your enterprise
- Proactively protect the interactions between users, applications and data across any location or device
- Harness 100 percent of your data types, regardless of source or scale to drive superior business outcomes
- Deliver experiences that empower employees and customers to create better outcomes

The need for an end to end intelligent network

A good network offers predictable performance, easier mobility, and provides a reliable platform. An intelligent network can be transformed into a platform for business innovation that helps you change the rules of the game.

The HPE Network Transformation Workshop helps you build a path from today's rigid legacy network, which is overprovisioned and underutilized, to the agile network of the future—one that is dynamically responsive to changing demands and one that can provide the intelligence and analytics to enable business decisions and investments.

Approach and methodology

This workshop is a highly interactive, Hewlett Packard Enterprise facilitated one-day session with your identified key stakeholders and senior HPE consultants. This structured discussion takes a fact-based, analytical approach to help you achieve alignment of your vision, identify your current and future states, and determine your specific transformation agenda.

Leveraging HPE's unique approach, we guide a Network Transformation discussion based on our experiences, from both a technology and business perspective. We focus on internal and external drivers, market trends, business drivers, and technology innovation. We then translate findings into a plan that is tailored for you.

We uncover answers to the following questions:

- How can I integrate and benefit from an all-wireless workplace, network virtualization, software-defined networking, IPv6 and mobility in my transformation?
- What is really happening in terms of demand, what are the user experiences we are trying to enable, who is our user?
- What is the right approach to an agile network that can dial up and dial down as required by the business and users?
- What is the operating model and management of an agile network infrastructure—how does that differ from what is being done today and what is required?

Figure 1: HPE Network Transformation

Enable your transformation with Network Virtualization and Software Defined networking (SDN)

On the provisioning side, in the data center, Network Virtualization and SDN are about IT optimization, orchestration and automation to align with the agility of compute and store.

On the consumption side, in the campus, SDN is about protection, visibility and user experience, and it must be delivered over the wired and wireless networks.

Hewlett Packard Enterprise has the experience to help you identify the right solution to drive value for the business.

Key elements which are explored as part of the Network Transformation workshop include:

- Identifying the potential value that an all-wireless workplace could deliver to the business
- Pinpoint business relevance of unified, seamless and secure connections to business resources at all locations, including home office
- Alignment on how Network Virtualization and SDN can deliver benefits to the business through more agile and responsive networks
- Discuss the specifics of a traffic flow transformation, use cases, architecture elements and provide an understanding of what support looks like in this new environment

Figure 2: HPE Trusted Network Transformation

This process uses the same HPE Transformation Workshop methodology delivered by HPE consultants for decades. We also offer Transformation Workshops in other IT areas such as Data Center, Cloud, and Workplace and Mobility, among others. This methodology and approach is used to achieve alignment on transformational programs in a matter of days versus months.

Create your transformation roadmap

By combining HPE's methodology, industry knowledge, and experience, along with your perspective and vision, we help you:

- Understand the benefits, scope, scale, and critical success factors of your unique Network Transformation
- Define a roadmap, with a desired end state, constraints, opportunities, and next steps
- Identify quick wins that can be pursued
- Gain stakeholder buy-in and alignment

At the conclusion of the Network Transformation Workshop, you will have your transformation definition; your initiative roadmap based on your goals, constraints, and short-term opportunities; and actionable recommendations to help move your transformation forward.

Go with experienced Network Consulting services

Is it your goal to deliver an agile network that can dynamically align with business needs in the idea economy? If so, it helps to have a trusted partner with the experience and practical approach to help navigate you through the best options for your organization, and how best to confidently take you forward to your end state vision. Here are good reasons to go with Hewlett Packard Enterprise:

- Expertise aligned to your needs and speed
- Reliable, secure, and delivered globally
- A holistic approach
- Collaboration at every turn

At Hewlett Packard Enterprise, our pivotal goal is to work with you for joint success. Get in touch with us today and schedule a Network Transformation Workshop. We can help you to find the right approach to an intelligent network that is flexible, agile and dynamically responsive to changing business demands.
